## Documentation Infrastructure Audit Report

Prepared by VeriOps

2026-05-05 11:18 UTC

CONFIDENTIAL | FOR INTERNAL USE ONLY

---

### Key Metrics

Pages scanned: 894

Report type: Premium Executive Audit

Methodology: 5-pillar automated analysis + expert synthesis

### Headline Findings

- Broken internal links: 8
- Link verification inconclusive for 5 URLs (auth/rate-limit/server block); these are excluded from broken-link counts.
- Example reliability estimate is low: 52.14%
- Freshness visibility is weak: only 7.72% pages show last updated

This report is generated automatically by the VeriOps platform. Estimates are directional.

Executive Summary

Documentation audit of docs.port.io covered 894 pages with 100% crawl coverage across a single-product topology. The site contains 8 confirmed broken internal documentation links and 5 unverified links excluded from counts due to authentication or rate-limiting. API reference coverage is complete at 100% across 411 detected API pages. Critical weaknesses include low example reliability at 52.14% and minimal freshness visibility with only 7.72% of pages displaying last-updated metadata. Overall audit confidence stands at 76.12%, with links confidence notably lower at 56.54%.

External posture: SEO/GEO issue rate **1.7%**, public API coverage **100.0%**, broken links **8**.

|                      |                   |                        |
|----------------------|-------------------|------------------------|
| 92<br>Audit Score    | A<br>Grade        | Low<br>Risk Band       |
| 894<br>Pages Scanned | 8<br>Broken Links | 1.7%<br>SEO Issue Rate |

Per-Site Breakdown

| Site URL              | Pages | Broken Links | API Cov % | Example Rel % | SEO Issue % |
|-----------------------|-------|--------------|-----------|---------------|-------------|
| https://docs.port.io/ | 894   | 8            | 100.0     | 52.1          | 1.7         |

Industry Benchmark Comparison

| Benchmark                         | Score | Gap |
|-----------------------------------|-------|-----|
| Top performers (Stripe, Twilio)   | 92+   | -0  |
| Industry average (developer docs) | 85    | +7  |
| Minimum acceptable                | 70    | +22 |
| Your score                        | 92    | -   |

## Board-Level Metrics

### Internal Metrics (from scorecard)

## Financial Exposure Model

| Low Estimate                                                                                                                                        | Base Estimate                                                                                                                                        | High Estimate                                                                                                                                        |
|-----------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| <div>\$140,822</div> <div>annual exposure</div> <div>Remediation: \$2,090</div> <div>Monthly loss: \$4,125</div> <div>Opportunity: \$7,436/mo</div> | <div>\$249,513</div> <div>annual exposure</div> <div>Remediation: \$5,445</div> <div>Monthly loss: \$12,903</div> <div>Opportunity: \$7,436/mo</div> | <div>\$431,728</div> <div>annual exposure</div> <div>Remediation: \$8,800</div> <div>Monthly loss: \$27,808</div> <div>Opportunity: \$7,436/mo</div> |

Remediation: finding-level effort model | Monthly loss: operational friction model | Opportunity: engineering/support/release delay

Risk Matrix

| ID                     | Issue                                  | Severity | Monthly Loss | Fix Cost |
|------------------------|----------------------------------------|----------|--------------|----------|
| F-LAYERS               | Missing required doc layers            | HIGH     | \$1,782      | \$825    |
|                        |                                        |          |              |          |
| F-FRESHNESS            | Documentation freshness debt           | MEDIUM   | \$1,122      | \$550    |
|                        |                                        |          |              |          |
| F-RETRIEVAL            | RAG retrieval quality risk             | MEDIUM   | \$2,257      | \$990    |
|                        |                                        |          |              |          |
| F-API-COVERAGE         | Undocumented API operations            | LOW      | \$2,904      | \$1,100  |
|                        |                                        |          |              |          |
| F-EXAMPLES-RELIABILITY | Code examples fail or are non-runnable | LOW      | \$2,244      | \$935    |
|                        |                                        |          |              |          |
| F-DRIFT                | Code/docs contract drift               | LOW      | \$1,901      | \$660    |
|                        |                                        |          |              |          |
| F-TERMINOLOGY          | Terminology inconsistency              | LOW      | \$693        | \$385    |
|                        |                                        |          |              |          |

Priority Action Plan (Next 14 Days)

| ID                     | Finding                                | Severity |
|------------------------|----------------------------------------|----------|
| F-LAYERS               | Missing required doc layers            | HIGH     |
|                        |                                        |          |
| F-FRESHNESS            | Documentation freshness debt           | MEDIUM   |
|                        |                                        |          |
| F-RETRIEVAL            | RAG retrieval quality risk             | MEDIUM   |
|                        |                                        |          |
| F-API-COVERAGE         | Undocumented API operations            | LOW      |
|                        |                                        |          |
| F-EXAMPLES-RELIABILITY | Code examples fail or are non-runnable | LOW      |
|                        |                                        |          |

Recommended Actions

1. Implement automated example testing pipeline to validate code samples and raise reliability above 85%  
[impact: critical, effort: high]
2. Fix all 8 confirmed broken internal documentation links immediately [impact: high, effort: low]

3. Deploy last-updated timestamps across all 894 pages with automated git-based tracking [impact: high, effort: medium]
4. Investigate and resolve 5 unverified links blocked by authentication or rate-limiting [impact: medium, effort: low]
5. Establish quarterly link validation process to address 56.54% links confidence gap [impact: medium, effort: medium]

## Expert Analysis: Strengths and Risks

### Strengths

- + Complete crawl coverage at 100% with 894 pages successfully indexed
- + Full API reference coverage at 100% across 411 API pages detected
- + Zero broken repository navigation links; all 8 broken links are user-facing documentation links
- + Strong crawl confidence at 95% and API detection confidence at 85%
- + Low SEO/geo issue rate at 1.73%

### Risks

- Example reliability critically low at 52.14%, indicating over half of code examples may be outdated or non-functional
- Freshness metadata present on only 7.72% of pages, preventing users from assessing content currency
- 8 confirmed broken internal documentation links degrade user navigation experience
- 5 unverified links due to authentication/rate-limiting represent unknown documentation quality gaps
- Links confidence at 56.54% suggests potential undetected link issues beyond confirmed breaks
- Overall confidence of 76.12% indicates moderate uncertainty in audit completeness
- Large page count (894) with minimal freshness tracking creates maintenance blind spots

### Limitations

- \* External audit cannot verify accuracy or correctness of technical content, only structural and linking integrity
- \* Example reliability is estimated through heuristics; actual code execution and functional testing not performed
- \* Authentication-protected pages and rate-limited endpoints (5 unverified links) could not be fully validated
- \* Freshness assessment relies solely on visible metadata; actual content currency requires subject matter expert review
- \* API coverage detection may miss non-standard API documentation patterns not matching common reference page structures

## Methodology

This audit applies a rigorous, repeatable methodology combining automated analysis with expert synthesis. The platform evaluates documentation quality across five pillars.

### 1. Automated Crawl + Structural HTML Analysis

Every public documentation page is crawled and analyzed for structural integrity, link health, navigation depth, and content organization. The crawler detects broken links, orphaned pages, redirect chains, and missing metadata.

### 2. SEO/GEO Scoring Model (24 Checks)

Each page is evaluated against 8 GEO checks (LLM/AI search optimization) and 16 SEO checks (traditional search engine optimization). Checks cover meta descriptions, heading hierarchy, fact density, URL structure, internal linking, and content depth.

### 3. API Reference Cross-Coverage Analysis

The platform compares published API reference documentation against the actual API surface (OpenAPI specs, GraphQL schemas, gRPC protos). Coverage gaps, undocumented endpoints, and stale references are identified.

### 4. Code Example Reliability Estimation

Code examples embedded in documentation are analyzed for syntactic correctness, completeness, and consistency with current API signatures. Reliability scores estimate the likelihood of examples working as documented.

### 5. Executive Synthesis and Prioritization

All quantitative findings are synthesized into actionable executive narratives. The analysis identifies patterns, prioritizes risks, and generates strategic recommendations calibrated to business impact.

Appendix A -- Economic Model Assumptions

| Assumption                          | Value |
|-------------------------------------|-------|
| engineer_hourly_usd                 | 110.0 |
| support_hourly_usd                  | 50.0  |
| release_count_per_month             | 8.0   |
| baseline_manual_sync_hours_per_week | 12.0  |
| avg_release_delay_hours             | 4.5   |
| monthly_support_tickets             | 800.0 |
| docs_related_ticket_share           | 0.22  |
| avg_ticket_handling_minutes         | 24.0  |

Note: estimates are directional and should be calibrated with client rates, release cadence, and support volume.

Appendix B -- Evidence Traceability

| Finding                                                          | Evidence Source                                   | Confidence |
|------------------------------------------------------------------|---------------------------------------------------|------------|
| F-LAYERS -- Missing required doc layers                          | policy pack + frontmatter layer scan              | HIGH       |
| F-FRESHNESS -- Documentation freshness debt                      | frontmatter date scan                             | HIGH       |
| F-RETRIEVAL -- RAG retrieval quality risk                        | retrieval_evals_report.json                       | HIGH       |
| F-API-COVERAGE -- Undocumented API operations                    | OpenAPI + docs text scan                          | HIGH       |
| F-EXAMPLES-RELIABILITY -- Code examples fail or are non-runnable | examples_smoke_report.json                        | HIGH       |
| F-DRIFT -- Code/docs contract drift                              | pr_docs_contract.json + api_sdk_drift_report.json | HIGH       |
| F-TERMINOLOGY -- Terminology inconsistency                       | glossary.yml forbidden terms scan                 | HIGH       |

All findings are traceable to automated checks. Evidence sources reference specific crawl data, API specs, or code analysis results.
